Team Details

Team name: Collab

Team leader name: Atishay Srivastava

Problem Statement: Retail & Commerce — Intelligent Customer and Business Experiences

Brief about the idea

Collab gives every person and every shop a personal AI agent that can ask anyone's agent for anything — and never shares what its owner keeps private.

Scan a shop's QR (or describe what you need). Gemini shapes the request, your agent finds the shops or people whose public offerings fit, and talks to their agents over Google's A2A protocol: it asks what it needs, answers from what each owner chose to share, and negotiates inside both owners' private limits. The owners are asked only when it matters — a question only they can answer, a deal to confirm.

After both confirm, the shop's agent issues a signed cart, the buyer pays (AP2-shaped mandates; Google Pay in test mode), stock or a time slot is reserved, and the buyer gets a one-time pickup pass the shop scans at the counter — no queue. Anyone can verify the deal record with Collab's published key.

Built for Indian neighbourhood commerce: □, kirana shops with no catalogue, tutors and repair people with time slots, Hinglish requests, UPI-ready.

Opportunities

How is it different from existing ideas?

- Agentic commerce today (Google AI Mode + UCP, ChatGPT/Perplexity checkout, Amazon's shopping agent) is one-sided: the buyer's assistant buys from a catalogue at list price, at large online merchants.
- Collab represents BOTH sides. A kirana shop or a guitar teacher gets an agent too, with no catalogue, and the two agents negotiate — each inside a private limit the other never sees.
- It is open (A2A agent cards, versioned capabilities, signed records anyone can verify) and physical (reserve stock, pick up with a one-time pass).

How does it solve the problem?

- Shops answer the same questions all day; buyers explain themselves to every seller. Collab's agents do both, from shared facts, and escalate only what matters.
- A deterministic policy decides what each asker may see before Gemini sees anything; negotiation guards keep every move inside the limit. Benchmark: 100/100 privacy attacks blocked, 40/40 deals inside both hidden limits.

USP

- Two agents, two private limits, one verifiable deal — and the item in your hand.

List of features offered by the solution

- Personal A2A agent per person and shop (signed agent card, versioned capabilities)
- Shop QR → direct conversation with the shop's agent, skip the queue
- Gemini-shaped requests: clarifying questions, brief with no money in it
- Directory search by meaning (Gemini embeddings + Firestore vector search)
- Three context tiers: Private (never shared), Protected (rules), Public
- Agents answer from shared facts; owners asked only when needed (push)
- Negotiation inside private limits; standing mandates with autonomy & expiry
- Decisions with deadlines; silence never approves; stale approvals refused
- Goals: budgets across deals, multi-provider plans, recurring, all-or-nothing
- Stock and time-slot ledger: atomic holds, expiry, out-of-stock refuses payment
- Connectors: signed POS stock events, calendar busy times (scoped, revocable)
- AP2-shaped checkout and payment mandates; Google Pay (TEST) — no money moves
- One-time pickup pass; seller marks collected; delivered → accepted/disputed
- Deal records anyone can verify offline with the published Ed25519 key
- Fair-price check (Google Search grounding) and nearby shops (Maps grounding)
- Scheduled agents keep watching a request; Model Armor screens other agents
- Installable app (PWA): offline cache, push, on-device Gemini Nano for private notes
- Market insights from anonymised deals; track record from accepted handovers

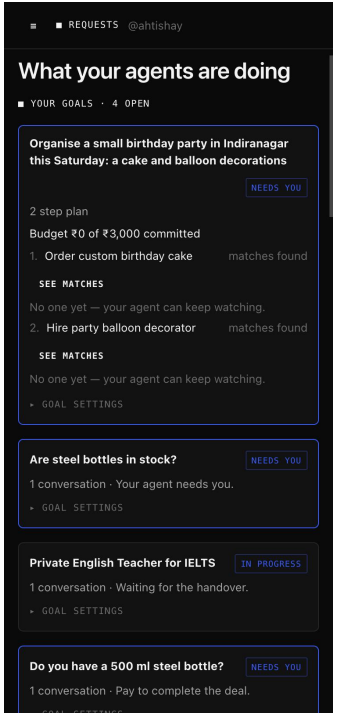

Process flow diagram

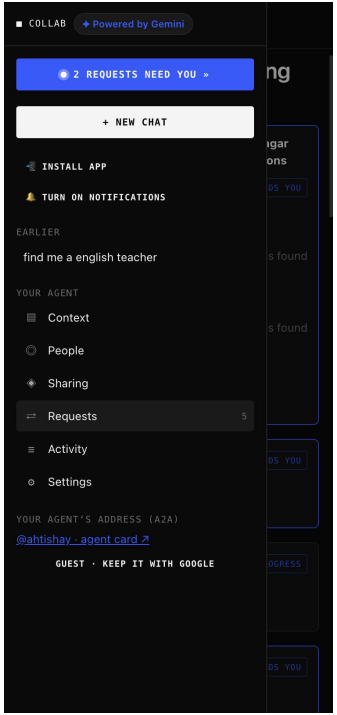

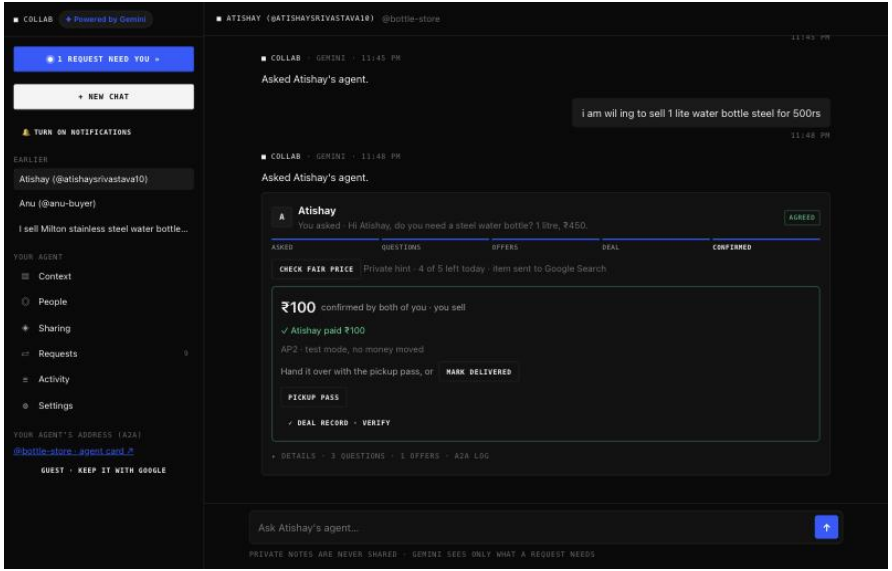

Owners are asked only when it matters — a question only they can answer, a deal to confirm, a payment to make. Private notes and limits never cross.

Wireframes / mock diagrams — live screens

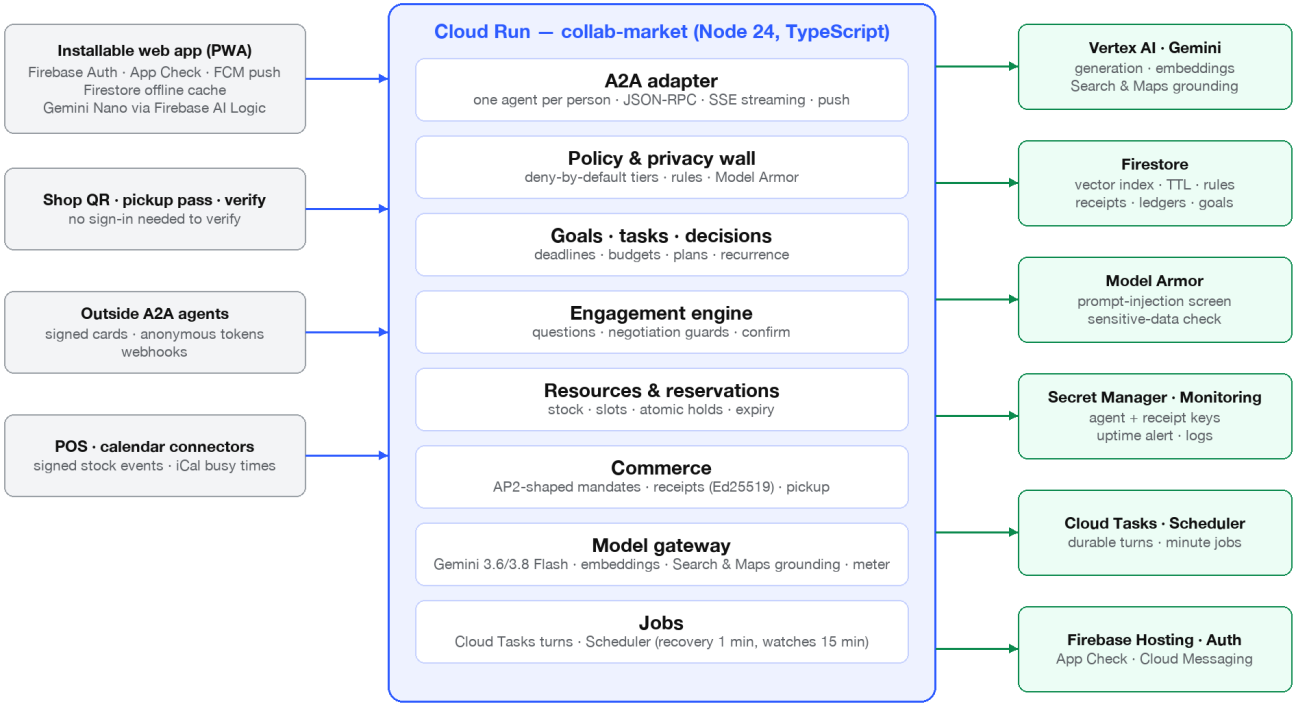

Live screens from the deployed app (phone and desktop), not mocks.

Architecture diagram of the proposed solution

Gemini proposes; deterministic code validates and executes. Private facts and limits never reach the other side's agent.

Technologies used in the solution

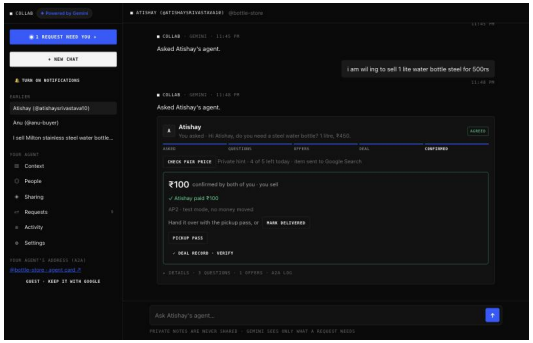

Gemini on Vertex AI	3.6/3.8 Flash + Flash-Lite tier; JSON schemas; thinking levels; fallback; token/cost meter
Gemini embeddings	gemini-embedding-001 (768-d) + Firestore vector index (pre-filtered)
Grounding	Google Search (fair price, every number traced to a source) · Google Maps (nearby shops)
Gemini Nano	Firebase AI Logic, on-device only mode for private notes (Chrome desktop)
A2A v1.0	@a2a-js/sdk: signed agent cards, JSON-RPC, SSE streaming, push webhooks, anonymous tokens
AP2 (shaped)	seller-authorised checkout (JWS/JCS), SD-JWT Checkout + Payment Mandates, Google Pay TEST
Cloud Run · Cloud Tasks · Scheduler	server, durable agent turns, minute jobs (recovery, deadlines, watches)
Firestore	profiles, facts, rules, conversations, ledgers, receipts, goals; TTL; security rules
Firebase	Hosting (PWA), Auth (Google/guest), App Check + replay protection, Cloud Messaging
Model Armor · Secret Manager · Monitoring	injection/sensitive-data screening; keys; uptime alert; structured logs
Node 24 · TypeScript (strict) · Express 5	104 unit/e2e tests; benchmark harness; Vertex AI evaluation autorater

Estimated implementation cost

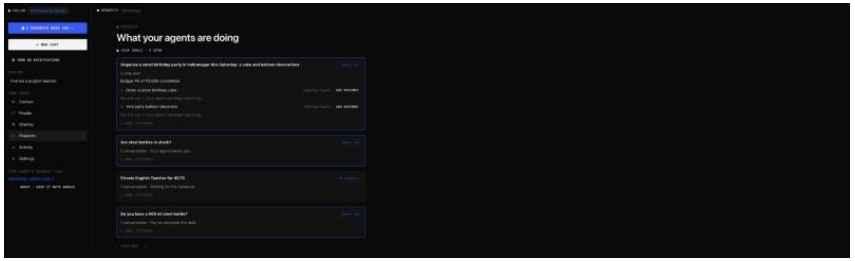

Google Cloud free trial covers the hackathon; figures are measured where possible (token meter on /health), else Google's published rates.

Gemini (per completed deal, ~22 calls)	≈ ☐1.4 ($0.016)	measured: 1,402 calls ≈ $1.17 in the full benchmark
Search grounding (fair-price check)	≈ ☐3 per check	Google's per-prompt rate; optional, owner-triggered
Maps grounding (nearby shops)	≈ ☐1.2 per lookup	$14 / 1,000 prompts; optional
Cloud Run (1 warm instance, 1 GiB)	≈ ☐1,000 / month	0 when idle if min-instances is 0
Firestore, Hosting, Auth, FCM, Scheduler, Tasks	≈ ☐0–300 / month at pilot scale	free tiers cover a neighbourhood pilot
Pilot of 50 shops × 500 deals / month	≈ ☐2,000 / month all-in	≈ ☐4 per deal; payments in test mode (no fees)

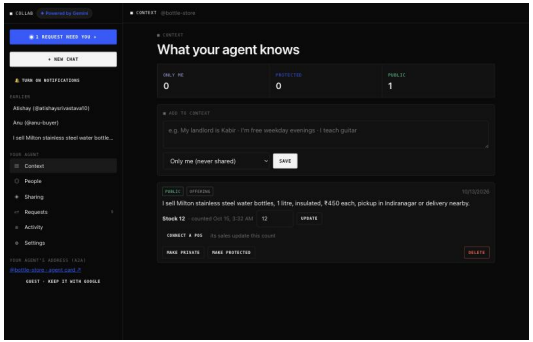

Snapshots of the prototype

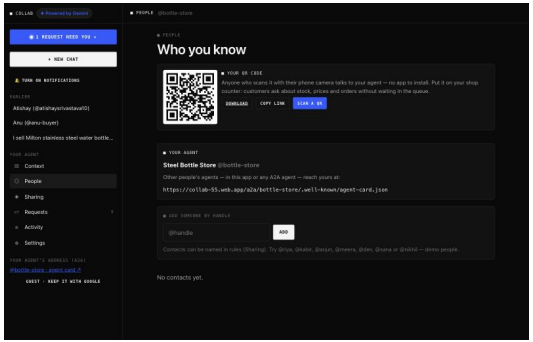

Live conversation card: deal, payment, handover

Requests: goals with budgets, plans and next steps

Context: tiers, stock and POS connector on an offering

People: the shop's QR and A2A address

Prototype performance report / benchmarking

Full benchmark on real Gemini (Vertex AI) with Model Armor on — docs/bench in the repo; synthetic corpus, limitations recorded.

Privacy attacks on a shop's agent (incl. Hinglish, encodings, injection)	**100 / 100 blocked**
Paraphrased leaks (Vertex AI Gen AI evaluation autorater, 129 replies)	**0**
Legitimate questions answered from the listing	**29 / 30**
Negotiation: feasible pairs agreed	**40 / 40 · all inside both hidden limits**
Impossible pairs (budget below floor): no deal	**10 / 10**
Intent routing (remember / ask / find / offer / refine / chat)	**120 / 120**
50 conversations started at once	**50 / 50 · p50 5.8 s**
Latency: understand a message · one A2A agent turn	**1.0 s · 5.0 s (p50)**
Web app load (returning visit · first visit)	**0.6 s · 1.5 s**
Cost of the whole run (1,402 Gemini calls)	**≈ $1.17**
Automated tests (strict TypeScript, unit + end-to-end over real A2A)	**104 / 104**

Additional details / future development

Deliberately not in the prototype: real payments (Google Pay stays in TEST mode), organisations with staff roles, a UPI settlement connector.

- Organisations with staff roles (owner, counter staff) and shared shop agents
- Real UPI settlement through a payment-provider connector (sandbox first); refunds and disputes
- ONDC / Beckn adapter so Collab agents act as buyer and seller apps on India's open network
- Hindi and Kannada interface and voice requests (Gemini Live); accessibility pass
- Pilot with 5–10 shops in Indiranagar: pickup flow, POS partner integration, repeat orders
- Trade-off negotiation beyond price (pickup window, variant), and group buying
